# SHTD Flow
# Deployment Evidence Report

Project: grobomo/spec-hook (public)
Report Date: 2026-04-03 22:02:00
EC2 Instance: i-05bc762ad4d8c37fc (ip-172-31-24-173)
Public IP: 3.129.204.76
Evidence: 10 hook phases × 2 modes (native + Docker) = 20 real xterm screenshots
Screenshots: Actual screen captures via xvfb + xterm + scrot (not rendered text)

Date: April 03, 2026

# Table of Contents

1. Executive Summary

2. Phase A: Native Linux Install (10 evidence captures)

3. Phase B: Docker Container Install (10 evidence captures)

4. Architecture & Hook Matrix

5. Test Coverage Summary

# 1. Executive Summary

This report proves that SHTD Flow (Spec-Hook-Test-Driven workflow enforcement) works correctly on a fresh EC2 instance in both native and Docker deployments. A fresh Ubuntu 22.04 instance was provisioned, Claude Code and SHTD Flow were installed from scratch, and all 10 hook phases were triggered and captured.

```
+ Fresh EC2 instance provisioned (Ubuntu 22.04, t3.large)
+ Claude Code 2.1.92 installed via npm
+ hook-runner auto-bootstrapped by install.sh
+ All 11 SHTD modules installed and verified
+ 10 hook phases tested in native mode — all block/allow correctly
+ Docker container created, same install repeated inside container
+ 10 hook phases tested in Docker — identical results
+ Each screenshot includes hostname, IP, timestamp, and user proving remote
execution
```

**Impact:** SHTD Flow is verified to work on clean installs with zero manual setup. The install.sh script auto-bootstraps everything including hook-runner. Both native Linux and Docker container deployments produce identical enforcement.

# 2. Phase A: Native Linux Install

Real xterm screen captures from EC2 instance ip-172-31-24-173 (3.129.204.76), user 'ubuntu', Node v20.20.2, Python 3.10.12. Each screenshot is an actual screen grab (xvfb + xterm + scrot) showing the hook module being invoked with the same JSON input Claude Code sends.

# 4. Architecture & Hook Matrix

| Hook Module | Enforces | Blocks When |
|---|---|---|
| shtd_spec-gate | Specs before code | No specs/ directory |
| shtd_branch-gate | No code on main | Edit on main/master branch |
| shtd_test-first-gate | Test before impl | No test file for claimed task |
| shtd_pr-per-task-gate | Task ID in PR | PR title missing TNNN |
| shtd_secret-scan-gate | CI required | No secret-scan.yml before push |
| shtd_remote-tracking-gate | Branch tracking | Branch has no remote upstream |
| shtd_e2e-merge-gate | E2E for merge | No .test-results/ evidence |
| shtd_workflow-gate | Step order | Prerequisite step not completed |
| shtd_task-claim | Task ownership | All tasks claimed by others |
| shtd_audit-logger | Event capture | (PostToolUse — logs, never blocks) |
| shtd_task-release | Claim cleanup | (Stop — releases claim on exit) |

# 5. Test Coverage Summary

| Area | Coverage | Visual |
|---|---|---|
| Native: hook phases | 10/10 | ========== |
| Docker: hook phases | 10/10 | ========== |
| E2E gate tests | 28/28 | ========== |
| YAML parser tests | 12/12 | ========== |
| Code review tests | 10/10 | ========== |
| Worker deployments | 4/4 | ========== |

74 total verifications across 6 test suites. 100% pass rate. Both native Linux and Docker container deployments produce identical enforcement behavior.
